                                                                                                                 The invention relates to nucleic acids and proteins (ADN38683-ADN40064)

CC whose expression is upregulated or downregulated in specific cancers or

CC other diseases such as angiogenic or fibrotic disorders, and to methods

CC of determining the presence or absence of a pathological cell in a

CC patient by detecting a nucleic acid at least 80% identical to those of

CC the invention or by detecting a polypeptide of the invention. The

CC invention also relates to expression vectors and host cells comprising a

CC nucleic acid of the invention; antibodies which specifically bind a

CC polypeptide of the invention; use of such antibodies for drug targeting;

CC and methods of screening for modulators of activity or expression of the

CC polypeptides and mucleic acids. The nucleic acids, polypeptides,

CC antibodies and methods are useful for diagnosing, prognosing and treating

CC cancer and other conditions such as psoriasis, ischaemia, heart disease,

CC atherosclerosis, inflammatory diseases, autoimmune diseases, retinal

CC cancer so the invention such as psoriasis, ischaemia, heart disease,

CC atherosclaristation syndromes, scarring and uterine fibroids. They may

CC also be useful in wound healing and in contraception. The present

CC sequence represents a nucleic acid sequence of the invention.

                                                                                                              from the tissues of various organisms such as humans or other mammals (e.g. mice, sheep and dogs). The methods of the invention are useful for diagnosing and treating prostate cancer in mammals. The prostate cancerassociated genes are useful for diagnosing or treating prostate cancer, as well as for identifying modulators of prostate cancer or agents that inhibit prostate cancer. The nucleic acid sequences are particularly useful in gene therapy, as a vaccine or in antisense applications. ABK92115.ABK92263 represent prostate cancer-associated polynucleotide
                                                                                                                                                                                                                                                      The present invention relates to methods of detecting a prostate cancer-associated transcript in a cell from a patient. The method comprises contacting a biological sample from the patient with prostate cancer-associated polynucleotides (designated PC genes) that selectively hybridise to a sequence that is at least 80% identical to them. The prostate cancer-associated polynucleotide sequences are differentially expressed in prostate tumour tissue or in prostate cancer and are derived expressed in prostate tumour tissue or in prostate cancer and are derived
                                                                                                                                                                                                                                                                                                                                                                                                                           Detecting a prostate cancer-associated transcript in a cell in a pauseful for diagnosing prostate cancer (PC) or screening modulators by determining if prostate cancer-associated genes are expressed in prostate tissue.

The invention is useful for selecting primers probes for detecting prostate cancer cells in a biological sample by using nucleic acid amplification techniques. The present sequence is human PMEPA1 cDNA. PMEPA1 gene chromosome 20q13
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             selecting primers and probes for detecting prostate cancer cells biological samples by nucleic acid amplification techniques.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            exon
                                                                                                                                                                          The present invention relates to the identification and characterisation of a novel androgen-regulated genes (ARGs) that exhibits abundant expression in prostate tissue. The novel gene is designated PMEPA1. The invention is useful for diagnosing and prognosing prostate cancer. The invention is also useful in hormonal therapy. The present sequence is
                                                                                                                                                                                                                                                                       Polynucleotide array, useful for diagnosing or prognosing prostate cancer, comprises a planar, non-porous solid support and a set of polynucleotide probes attached to the solid support.
                                                                                                                                                                                                                                                                                                                                                                      Srivastava S,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to androgen-regulated gene (ARG), PMEPA1 and its encoded protein. PMEPA1 polypeptide is useful in inhibiting the growth of a prostate cancer (CaP) cell. It is also useful for reducing the expression of an androgen receptor or modulating the expression of a gene in a prostate cancer cell. PMEPA1 sequence is useful in gene therapy, useful to prepare vaccines, useful as markers of prostate cancer and other prostate-related diseases, and as targets for therapeutic intervention in prostate cancer and other prostate-related diseases. PMEPA1 its encoding nucleic acid or the antibodies are useful for detecting, preventing and treating prostate cancer. The present sequence is human PMEPA1 cDNA. This sequence is used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        28-JAN-2000;

The invention relates to newly discovered cancer markers associated with the cancerous state of prostate cells. Also disclosed is a method of assessing whether a patient is afflicted with prostate cancer. The method of the invention involves assessing whether a patient is afflicted with prostate cancer by comparing the level of expression of a marker in a patient sample and the normal level of expression of the marker in a control non-prostate cancer sample, where a significant increase in the level of expression of the marker in the patient sample and the normal

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               level indicates that the patient is afflicted with prostate cancer. Nucleic acids of the invention are useful for diagnosing or treating prostate cancer, and may be useful in gene therapy. Sequences given in ADB75177-ADB75631 represent marker cDNA and proteins. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

                                                                                                                                                                                                                                                                             ACC49493 to ACC49552 encode the human tumour-associated antigenic target (TAT) proteins given in ABP97175 to ABP97234. The present invention describes an isolated antibody that binds to a polypeptide having at least 80 % sequence identity to any of the 60 150-800 residue amino acid sequences (S1), given in ABP97175 to ABP97234, comprising (S1), lacking its associated signal peptide, encoded by any of the 60 2000-3000 base pair sequences (S2), given in ACC49493 to ACC49552. TAT proteins have cytostatic activity. The antibody can be used for treating or diagnosing tumours or cancers in mammals, e.g. prostate cancer, lung cancer, breast cancer, colon cancer; oversian cancer, prostate adenocarcinomas, renal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New antibodies against tumor-associated antigenic target polypeptide useful for treating or diagnosing tumors or cancers in mammals, e.g. prostate cancer, lung cancer, prostate adenocarcinomas or renal cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                            prostate cancer, carcinomas.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a substantially pure androgen responsive CC prostate specific (ARP) nucleic acid molecule selected from ARP1-ARP5 (appearing as ADL83312, ADL83313, ADL83315, ADL83317 and ADL83319. Also included are methods of diagnosing or predicting susceptibility to a prostate neoplastic condition in an individual, methods for treating or reducing the severity of a prostate neoplastic condition in an individual, a substantially pure ARP3, ARP4 or ARP5 polypeptide (or their fragments, encoded by the above ARP3, ARP4 or ARP5 nucleic acid molecule, respectively) and a binding agent comprising a molecule that selectively binds the above ARP3, ARP4 or ARP5 polypeptide. The nucleic acid molecules and polypeptides are useful in diagnosing, preventing and treating prostate cancer or other prostate pathologies such as benign prostation probes in various diagnostic procedures. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ADV85880
                     The present invention relates to a androgen regulated prostate specific polypeptide-5 (ARP-5) and its encoding nucleic acid. The invention is useful for diagnosing and treating prostate cancer or other prostate pathologies such as benign prostatic hyperplasia or prostatitis. The invention is also useful in gene therapy. The present sequence is the
                                                                                                                                                                                                                                                             New androgen regulated prostate specific polypeptides (e.g. ARP-5, -3 -4) and encoding nucleic acids for diagnosing, preventing or treating prostate cancer or other prostate pathologies (e.g. benign prostatic

                                                                                                                          cc individual having contracted cancer, which comprises determining the cc microsatellite status of the tumor. The microsatellite status or the cc microsatellite status of the tumor. The microsatellite status or the cancer is determined by a method cc comprising; (a) obtaining a sample from the individual having contracted cc and/or amount of which forms a pattern that is indicative of the cancer; the sample comprising gene expression products, the presence cc microsatellite status or the hereditary or sporadic nature of the cancer; (b) determining the pattern, and obtaining an indication of the gene expression comproducts forming a pattern used to determine the cancer in the individual based on step (b). At least one or two of the gene expression products forming a pattern used to determine the cancer cc microsatellite status or the hereditary or sporadic nature of the cancer in the individual based on step (b). At least one or two of the gene expression products forming a pattern used to determine the cancer cc microsatellite status or the hereditary or sporadic nature of the cancer cc microsatellite status or the hereditary or sporadic nature of the cancer cc are selected individually from any of the 134 genes comprising 367-7850 bp (AEB22706 to AEB22839), given in the specification. Also included are: creating a classified cancer, comprising at least one malignancy of a cell; a method for treating a hidridual; a method for reducing malignancy of creating a classified cancer, comprising at least one marker in an individual having contracted cancer, cc comprising at least one marker in an individual having contracted cancer, cc comprising at least one marker one marker in a sample determining the prognostic marker, where the microsatellite status and the prognostic marker is determined simultaneously or sequentially. The method above is useful for probacing an assay contracted composition for the treatment of a cancer in animal tissue. The method is useful for probacing an adenocarcinoma. a carcinoma.

CC microgatellitte status or the hereditary or sporadic nature of the cancer; CC (b) determining the presence and/or amount of the gene expression CC products forming the pattern, and obtaining an indication of the CC microsatellite status or the hereditary or sporadic nature of the cancer CC in the individual based on step (b). At least one or two of the gene CC expression products forming a pattern used to determine the CC are selected individually from any of the 134 genes comprising 367-7850 (c) p(ABB22706 to ABB22839), given in the specification. Also included are: CC are selected for producing antibodies against an expression product of a cell; a method for producing antibodies against an expression product CC of a cell; a method for producing antibodies against an expression product CC of a cell; a method for reducing an individual; a method for reducing malignancy of CC action of cancer, comprising at least one macleic acid and/or probe; and an assay, comparising at least one marker capable of determining the microsatellite status in a sample and at least one marker in a sample determining the microsatellite status in a sample and at least one marker in a sample determining the composition for the treatment of a cancer in an individual. The method above is useful for producing an assay for classifying cancer in animal tissue. The present set of composition for the treatment of a cancer in an individual having contracted cancer, i.e. colon cancer, e.g. an adenocarcinoma, a carcinoma, a sarcoma, and/or a lymphoma. The present sequence represents a concertion of the treatment of a cancer in an individual having contracted cancer.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a method of classifying the cancer in an individual having contracted cancer, which comprises determining the microsatellite status of the tumor. The microsatellite status or the hereditary or sporadic nature of the cancer is determined by a method comprising: (a) obtaining a sample from the individual having contracted

                                                                                                                                                                                                                                                                                                                                                                                         Matches 788;
                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                            immunosuppressant and cytostatic activity. The polymucleotides are useful in gene therapy. A composition containing a polymeptide or polymucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system disease, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, Activin/inhibin activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and C.N.S disorders. Note: The sequence data for this patent did not form part of the printed specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            19-JUL-2000;

```

The present sequence encodes the human androgen regulated PMEPA1 protein (I), which inhibits the growth of prostate cancer (LNCaP) cells in a colony-forming assay. Also described: (1) a method of reducing the

androgen receptor in a prostate

cancer

(2) a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                method of inhibiting the growth of a prostate cancer cell; (3) a method of modulating the expression of a gene in a prostate cancer cell; where transcription of the gene is regulated by an androgen receptor; (4) a method for diagnosing or prognosing prostate cancer; (5) a method of screening for compounds that specifically bind to (1); and (6) a method of evaluating the efficacy of a treatment in a patient with prostate cancer. (1) has cytostatic activity, and can be used in gene therapy. (1) polypeptides and polynuclectide can be used in reducing the expression of a prostate cancer cell, diagnosing or prognosing prostate cancer, evaluating the efficacy of a treatment in a patient with prostate cancer, treating the prostate cancer, treating the cancer cell and prostate cancer.
                                                                                                                                                                                                   1122

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ADH62277
                                                                                                                                                                                                                                                                                              The present invention relates to the identification and characterisation of a novel androgen-regulated genes (ARGs) that exhibits abundant expression in prostate tissue. The novel gene is designated PMEPA1. The invention is useful for diagnosing and prognosing prostate cancer. The invention is also useful in hormonal therapy. The present sequence is human PMEPA1 coding cDNA. The PMEPA1 gene is located on chromosome 20q13
                                                                                                                                                                                                                                                                                                                                                                                         Claim 10; SEQ ID NO 2;

                            New PMEPA1 polypeptide that inhibits the growth of LN prostate cancer (LNCaP) cells in a colony-forming assay, useful for detecting, preven
treating prostate cancer.
                                     preventing
```

Claim 3; SEQ ID NO 2; 78pp; English.

The invention relates to androgen-regulated gene (ARG), PMEPA1 and its encoded protein. PMEPA1 polypeptide is useful in inhibiting the growth of a prostate cancer (Cap) cell. It is also useful for reducing the expression of an androgen receptor or modulating the expression of a androgen receptor or modulating the expression of a gene in a prostate cancer cell. PMEPA1 sequence is useful in gene therapy, useful to prepare vaccines, useful as markers of prostate cancer and other prostate-related diseases, and as targets for therapeutic intervention in prostate cancer and other prostate-related diseases. PMEPA1, its encoding nucleic acid or the antibodies are useful for detecting, preventing and treating prostate cancer. The present sequence is human PMEPA1 cDNA. This sequence is used in the exemplification of the invention. invention.

The present sequence encodes a human TANGO 261 polypeptide. The specification also describes TANGO 266, TANGO 216, TANGO 262, and TANGO 267. The TANGO polypeptides can be used to modulate cellular proliferation, modulate cellular differentiation and/or modulate cellular adhesion. The proteins can be used to treat any von Willebrand factorassociated disorder, regulate extracellular matrix structuring, cellular adhesion, and cell trafficking and/or migration, modulate cellular interactions, modulate cell adhesion in proliferative disorders, such as cancer, modulate the proliferation, differentiation, and/or function of cells that appear in the bone marrow, and leukocytes, treat bone marrow, blood and hematopoietic associated diseases and disorders, atelectasis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  TANGO 266; TANGO 216; TANGO 261; TANGO 262; TANGO 267; cellular proliferation; cellular differentiation; cellular adhesion; cellular differentiation; cellular adhesion; von Willebrand factor-associated disorder; cell trafficking; cancer; hematopoietic associated disease; atelectasis; pulmonary congestion; oedema; emphysema; chronic bronchitis; bronchial asthma; bronchiectasis; intestinal disorder; spleen associated disease; renal disorder; cardiovascular disorder; ischemic heart disease; renal disorder;

                                                                                    Human neuron-associated proteins (NEUAP) can be used for for treating or preventing a disorder associated with decreased expression or activity of NEUAP. Antagonists of NEUAP are useful for treating or preventing disorder associated with increased expression or activity of NEUAP. NEUAP or their fragments or derivatives are useful for treating neurological disorder such as epilepsy, ischemic cerebrovascular disease, stroke, cerebral neoplasms, Alzheimer's disease, Pick's disease, Huntington's disease, dementia and Parkinson's disease. NEUAPB are also useful for treating other demyelinating diseases, bacterial and viral meningitis, prion diseases including kuru, Creutzfeldt-Jakob disease, nutritional and metabolic diseases of the nervous system, neurofibromatosis, other developmental disorders of the central nervous system, cerebral palsy,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              muscular dystrophy; central nervous system; CNS; peripheral nervous system; PNS; myopathy; schizophrenia; peripheral nervous system; PNS; myopathy; schizophrenia; actinic keratosis; arteriosclerosis; attherosclerosis; bursitis; cirrhosis; hepatitis; mixed connective tissue disease; MCTD; myelofibrosis; paroxysmal nocturnal haemoglobinuria; cancer; autoimmune disease; inflammation; acquired immunodeficiency syndrome; alboring; Addison's disease; adult respiratory distress syndrome; allergy; ankylosing spondylitis; amyloidosis; anaemia; asthma;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to novel proteins and their coding sequences (ADC37168-ADC37458), which activate nuclear factor kappa B (N kappaB). The proteins and their coding sequences are useful for treatin a disease associated with NF-kappaB activation, such as inflammation, autoimmune diseases, cancers, infectious diseases, bone diseases, neurodegenerative diseases, or ischaemic disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      WPI;

                                                                                                                                                                                                                                                                                                                                                       8
                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a secretory polynucleotide (designated sptm) CC comprising any of 567 polynucleotide sequences (ABZ35837-ABZ36403), a CC naturally occurring polynucleotide sequence at least 90 % identical to the polynucleotide sequence, a polynucleotide complementary to them or an CC RNA equivalent of them. The polypeptide or polynucleotide are useful for treating, preventing or diagnosing a disease or condition associated with CC the expression of functional SPTM. These are particularly useful for CC treating preventing autoimmune/inflammatory disorders (e.g. acquired immunodeficiency syndrome, anaemia, asthma or Crohn's CC (e.g. acquired immunodeficiency syndrome, anaemia, asthma or Crohn's CC (disease), neurological disorders (e.g. epilepsy, Huntington's disease, CC disease), anxiety, and the sequence of the sequence of the brain, correspondent, melanoma, myeloma, sarcoma or cancers of the brain, correspondent, cervix or prostate). Note: The sequence data for this patent did cont form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            CC AAA75163-65 encode human TANGO 261 proteins. The specification also CC describes TANGO 266, TANGO 216, TANGO 262, and TANGO 267. The TANGO CC polypeptides can be used to modulate cellular proliferation, modulate cellular adhesion. The proteins CC can be used to treat any von willebrand factor-associated disorder, CC trafficking and/or migration, modulate cellular adhesion. The proteins CC cellular adhesion in proliferative disorders, such as cancer, modulate the proliferation of cellular interactions, modulate cellular interactions modulate the proliferation, differentiation, and/or function of cells that appear in CC thematopoietic associated diseases and disorders, such as cancer modulate the bone marrow, and leukocytes, treat bone marrow, blood and pulmonary congestion or oedema, emphysema, chronic bronchitis, bronchial asthma and bronchiectasis, intestinal disorders, spleen associated diseases, complete associated diseases, modulate the proliferation, differentiation, and/or cartilage cells and to treat bone and/or cartilage cells and to treat diseases, maltiple sclerosis, and cerebral coedema, bacterial and viral conceptabilitis, all treat hepatic diseases, brain cancers, hydrocephalus, brain conceptabilitis, and treat hepatic disorders. note: the present sequence codes not appear in the specification; it was created using information
